

Dilemma: Student Information System

Situation:

The Student Information System (SIS) is the beating heart of student administration. It contains information such as study offers, enrolments, progress and grades. Your SIS provider offers to store data at an American company with an impressive track record. A so-called big tech company.

They are known for their scalability, security and lowest prices. SIS data can also be stored on a European platform, in a Dutch data centre. Close to home then, and European legislation – without discussion – fully applies. However, the price is considerably higher, almost 1.5x higher than the offer from the big tech company.

Decision:

The institution plans to use the US big tech company to store the SIS data. Do you

agree or disagree?
